

Danger! Here comes Global Warming

Global Warming is when the earth gets hot and our climate gets very warm. Global Warming is caused by too many fossil fuels in the air. Fossil fuels are gasoline, coals, and natural gas from gas station. When we burn fossil fuels it puts CO<sub>2</sub> in the air. CO<sub>2</sub> traps the sun's heat and our earth gets warmer.

Global Warming is affecting animals

The earth is getting hot and the animals are dying because we are using too much fossil fuels and making the earth warmer. The earth is getting so hot that the polar bears and penguins are dying because the sun is heading over to the Antarctica and the ice is melting. These animals need ice and cooler air to stay alive. When the earth gets warm they don't have the things they need and they die.

How could we stop Global Warming

We can help stop global warming and save animals by using less electricity and less fossil fuels. You can save energy by

taking a bus or walking or taking a bike. Don't use a car all the time because we put  $\text{CO}_2$  in the air because of the gas. I want to stop global warming so the polar bears and the penguins could not die and have a life.
